

Assignment 1 - Git & GitHub Fundamentals

Report

Full Name: Aya Drissi

Student ID: 147970

Course Code & Section: CSC 3324, FA26-SSE-CSC332401

GitHub Username: Aya-Drissi

1. Repository Setup

I created the project folder git-session1-Aya-Drissi from the starter files and ran "git init" to turn it into a Git repository. I then created a .gitignore file that ignores local.env (a local configuration file that should not be shared) and all .log files, with an exception for important.log so Git can still track it. I checked the result with "git status" and "git check-ignore -v".

```
Ce Pc@DESKTOP-JEHV1UU UCRT64 ~/Desktop/Software Engineering/Lab/git-session1-Aya-Drissi (main)
$ git status
On branch main
Your branch is ahead of 'origin/main' by 1 commit.
(use "git push" to publish your local commits)

Untracked files:
  (use "git add <file>..." to include in what will be committed)
      README-FIRST.txt
      important.log
      notes.txt

nothing added to commit but untracked files present (use "git add" to track)
```

```
Ce Pc@DESKTOP-JEHV1UU UCRT64 ~/Desktop/Software Engineering/Lab/git-session1-Aya-Drissi (main)
$ git check-ignore -v local.env app.log debug.log important.log
.gitignore:2:local.env    local.env
.gitignore:5:*.log       app.log
.gitignore:5:*.log       debug.log
.gitignore:8:!important.log    important.log
```

2. README & Commit History

My README.md contains my name, my GitHub username, a short description, the technologies used, a code block, a link, and the provided project banner image. I organized my work into small commits that each have one purpose: .gitignore, homepage and styles, JavaScript file, README, banner image, homepage text update, status message update, About page, and a local README note. One more commit was made directly on GitHub.

3. Selective Staging

I edited two tracked files, index.html and app.js, at the same time. I used "git add index.html" to stage only the homepage file, and "git status" showed index.html under "Changes to be committed" while app.js was still under "Changes not staged for commit". I then committed with "git commit", and only index.html was included. app.js stayed modified until I committed it separately afterwards.

```
Ce Pc@DESKTOP-JEHV1UU UCRT64 ~/Desktop/Software Engineering/Lab/git-session1-Aya-Drissi (main)
$ git show --stat e035ed6
commit e035ed62b1fc4261c8bbba4f49e134e8c454186e
Author: Aya Drissi <drissiaya86@gmail.com>
Date: Thu Oct 8 21:48:09 2026 +0000

    Update homepage overview text

index.html | 4 ++--
1 file changed, 2 insertions(+), 2 deletions(-)
```

4. Branch & Merge

I created a branch called about-feature with "git switch -c about-feature" and added an About page (about.html) there in its own commit. I then switched back to main with "git switch main" and ran "git merge about-feature". Because main had no new commits in the meantime, Git did a fast-forward merge, which simply moved main forward to include the About commit.

```
Ce Pc@DESKTOP-JEHV1UU UCRT64 ~/Desktop/Software Engineering/Lab/git-session1-Aya-Drissi (main)
$ git log --oneline --graph --all
* bf55f24 (HEAD -> main) Add local note to README
* e35ce44 (origin/main, origin/HEAD) Revise project description in README.md
* c950038 (about-feature) Add About page
* 9e5bf47 Update status in app.js
* e035ed6 Update homepage overview text
* 7cc1a60 Add project banner image
* 10cc0e8 Add README with project detail
* 40c7122 Add starter JavaScript file
* 9be484c Add starter homepage and styles
* e5b0d59 Add .gitignore for local.env and log files
```

5. Remote Changes

A commit saves a snapshot of my work in my local repository only. A push uploads my local commits to the remote repository on GitHub, so commit changes my history and push shares it.

After editing README.md directly on GitHub, I ran "git fetch". Fetch downloads the new remote commits and updates origin/main without changing my local files, so "git status" showed my local main was behind origin/main by 1 commit. I then ran "git pull", which fetches and also merges the remote changes into my current branch, so my local README.md was updated.

```
Ce Pc@DESKTOP-JEHV1UU UCRT64 ~/Desktop/Software Engineering/Lab/git-session1-Aya-Drissi (main)
$ git status
On branch main
Your branch is behind 'origin/main' by 1 commit, and can be fast-forwarded.
  (use "git pull" to update your local branch)

Untracked files:
  (use "git add <file>..." to include in what will be committed)
        README-FIRST.txt
        important.log
        notes.txt

nothing added to commit but untracked files present (use "git add" to track)
```

```
Ce Pc@DESKTOP-JEHV1UU UCRT64 ~/Desktop/Software Engineering/Lab/git-session1-Aya-Drissi (main)
$ git pull
Updating bf55f24..8c9c16e
Fast-forward
 README.md | 3 ++-
 1 file changed, 2 insertions(+), 1 deletion(-)
```

6. Fair Use of AI

I used an AI assistant (Claude) to guide me through the assignment one step at a time. I asked it which Git command to run next, what an error message meant, and why a command behaved the way it did. I ran every command myself in Git Bash and took the screenshots from my own terminal. I followed the suggested commands but chose my own commit messages and file content in some places, and I fixed my own typing mistakes, such as "get init" and "git staus". I checked each answer by reading the command output and confirming it with "git status", "git log" and "git diff" before moving on, and I looked at my repository on GitHub to confirm the result. I understand each command I used.

7. Sources & Reflection

Sources: Session 1 slides and the assignment instructions provided by the lab instructors, and the Pro Git book (<https://git-scm.com/book>).

The hardest concept for me was the difference between the working directory, the staging area and the commit history, especially when two files were modified and only one was staged. If Git behaves unexpectedly, I would first run "git status" to see which branch I'm on and what is staged, then "git log --oneline --graph --all" to check the history.
